

KID·JZ — child-friendly loop

A three-node, child-friendly public-service loop: safe school route, playground and family stop. The map is a provisional concept frame.

KID·JZ

Child-friendly Mobility & Play Loop

Parent identity / cultural signage / event sub-brands stay separate.

Overall layout

Three positionings, five functions and three nodes are conceptually linked by blue-green walking and service interfaces.

Three-tier scope and overall layout (concept)

Coordinated research area → overall design area → three key nodes

PROVISIONAL — concept geometry only; verify boundary, rights, traffic and safety before implementation.

Three nodes

Each node has a known/unknown list, decision gate, human role, process indicator and stop/removal action.

Three nodes: section, programme and operations (concept)

Ecosystem and scenario cards

Six registered AI ecosystem mechanisms are kept separate from six background child/slow-mobility cases; all ten cards prohibit individual tracking.

AI innovation ecosystem + scenario-card index (concept)

Mobility and land-use caliber

East-west stitching, north-south connection and the Dazhongsi service interface remain concept/to-verify; land-class and design-layer ratios are distinct.

Slow-traffic and blue-green structure (concept)

Land-use structure — single caliber (concept)

Eight conceptual land-class shares by union area / provisional site area; rounded display sums to 100.00%

Top: land-class caliber

Park green (1401) 26.94%	Research (0802) 17.65%
Residential (0701) 17.25%	Commercial (0901) 11.58%
Business/finance (0902) 9.14%	Education (0804) 7.62%
Community service (0702) 6.77%	Sports (0805) 3.06%

Design green ratio
~12.4% (display 0.124)
Audit 0.12424986646180651
= green-space layer / site area

Public-space ratio
~0.45% (display 0.004)
Audit 0.004490562000963465
= public-space layer / site area

Separate calibers: the 26.94% park-green land-class share and the ~12.4% design-layer ratio use the same denominator but different numerators; official data triggers both recalculations.

PROVISIONAL — no statutory land-use, FAR or height conclusion.

PROVISIONAL / CONCEPT — verify official data, rights, safety and staffing before implementation.

Audit - display and privacy

Exact values, rounded display fields and formulas are registered in metrics.json. Anonymous aggregation, human review and ordinary-service fallback are non-negotiable.

Metric audit — display (concept geometry)

Exact geometry values are never silently replaced by rounded labels.

site_area_sqm AUDIT 11,412,825.385554 DISPLAY 11,413,000 ~11.4m sqm	green_space_area_sqm AUDIT 1,418,042.030107 DISPLAY 1,418,000 ~1.42m sqm	public_space_area_sqm AUDIT 51,250 DISPLAY 51,000 ~51k sqm
green_ratio AUDIT 0.12424986646180651 DISPLAY 0.124 ~12.4%	public_space_ratio AUDIT 0.004490562000963465 DISPLAY 0.004 ~0.45%	

Rule: audit_value/value remains the geometry result; display_value_numeric is rounded by the recorded rule; display_value is the human label. Ratios use ratio units in machine fields and percent labels only in the display.

Trigger: official boundary, green-space or public-space data release → recompute numerator, denominator, audit value and every display field together.

PROVISIONAL — values are design-model evidence, not official planning conclusions.
