

Overall urban design: from heritage corridor to civic-intelligence network

A 43.6 km² strategy, 11.41 km² overall design, 368.4 ha across three focus areas, and three representative nodes form one source-aware multi-depth system.

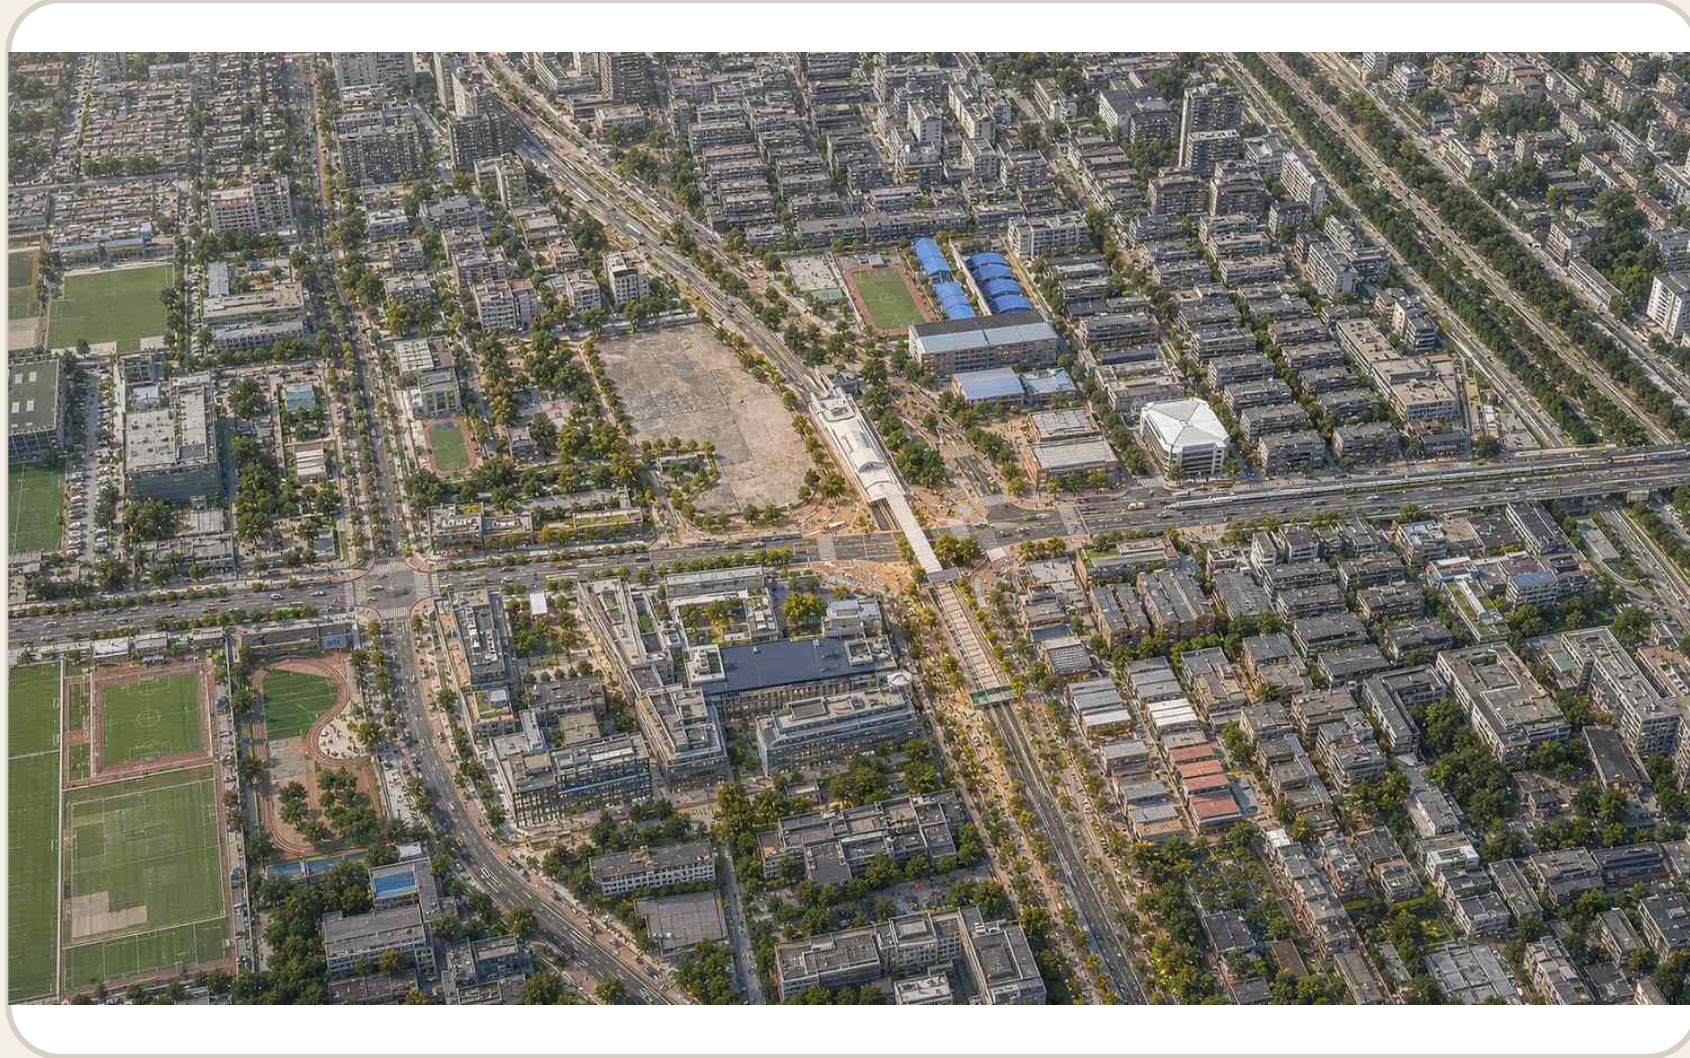

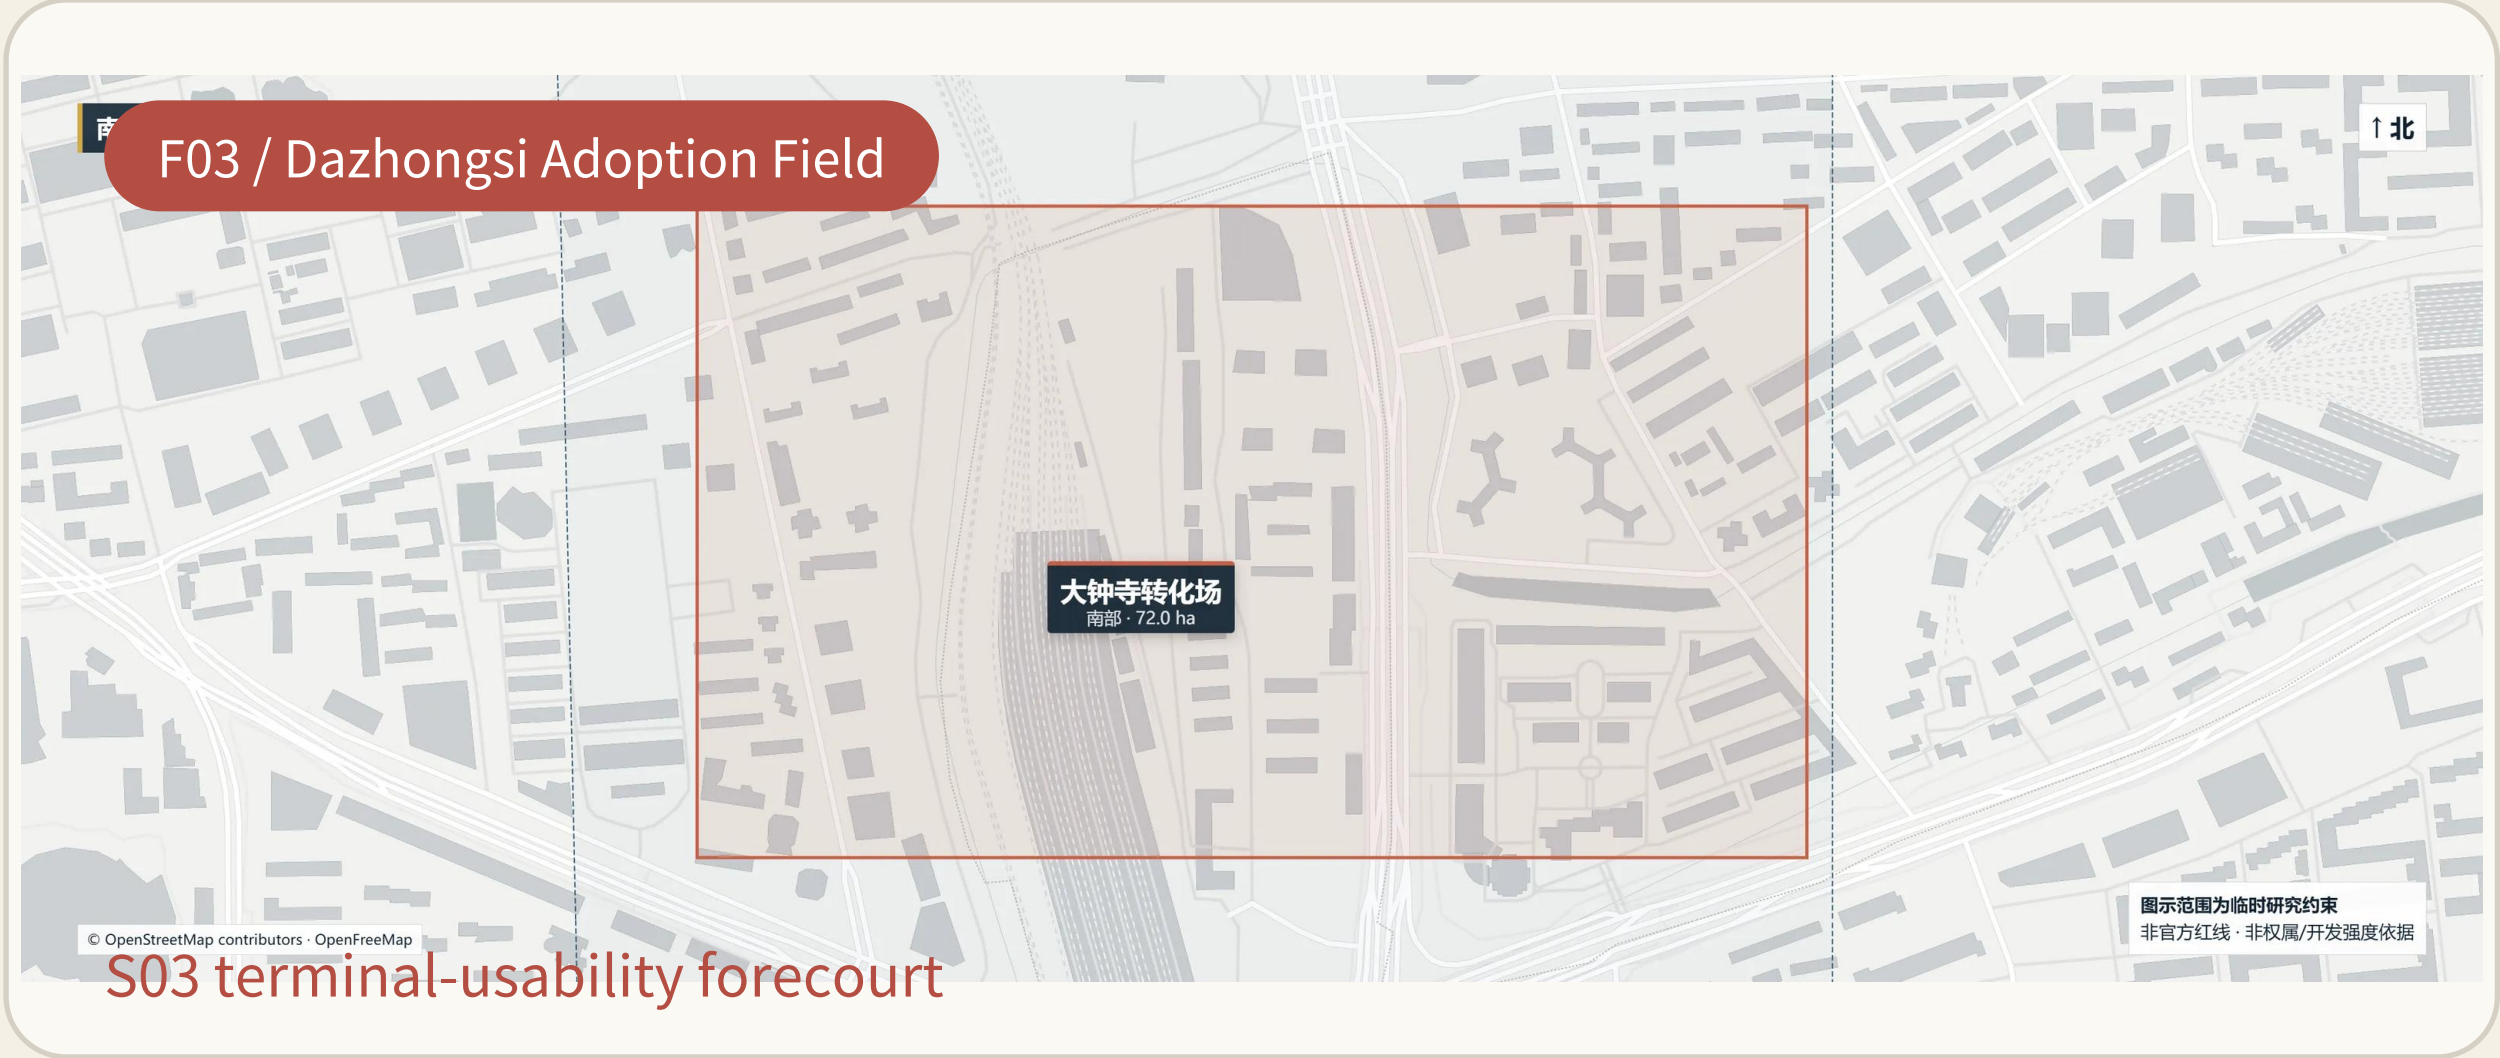

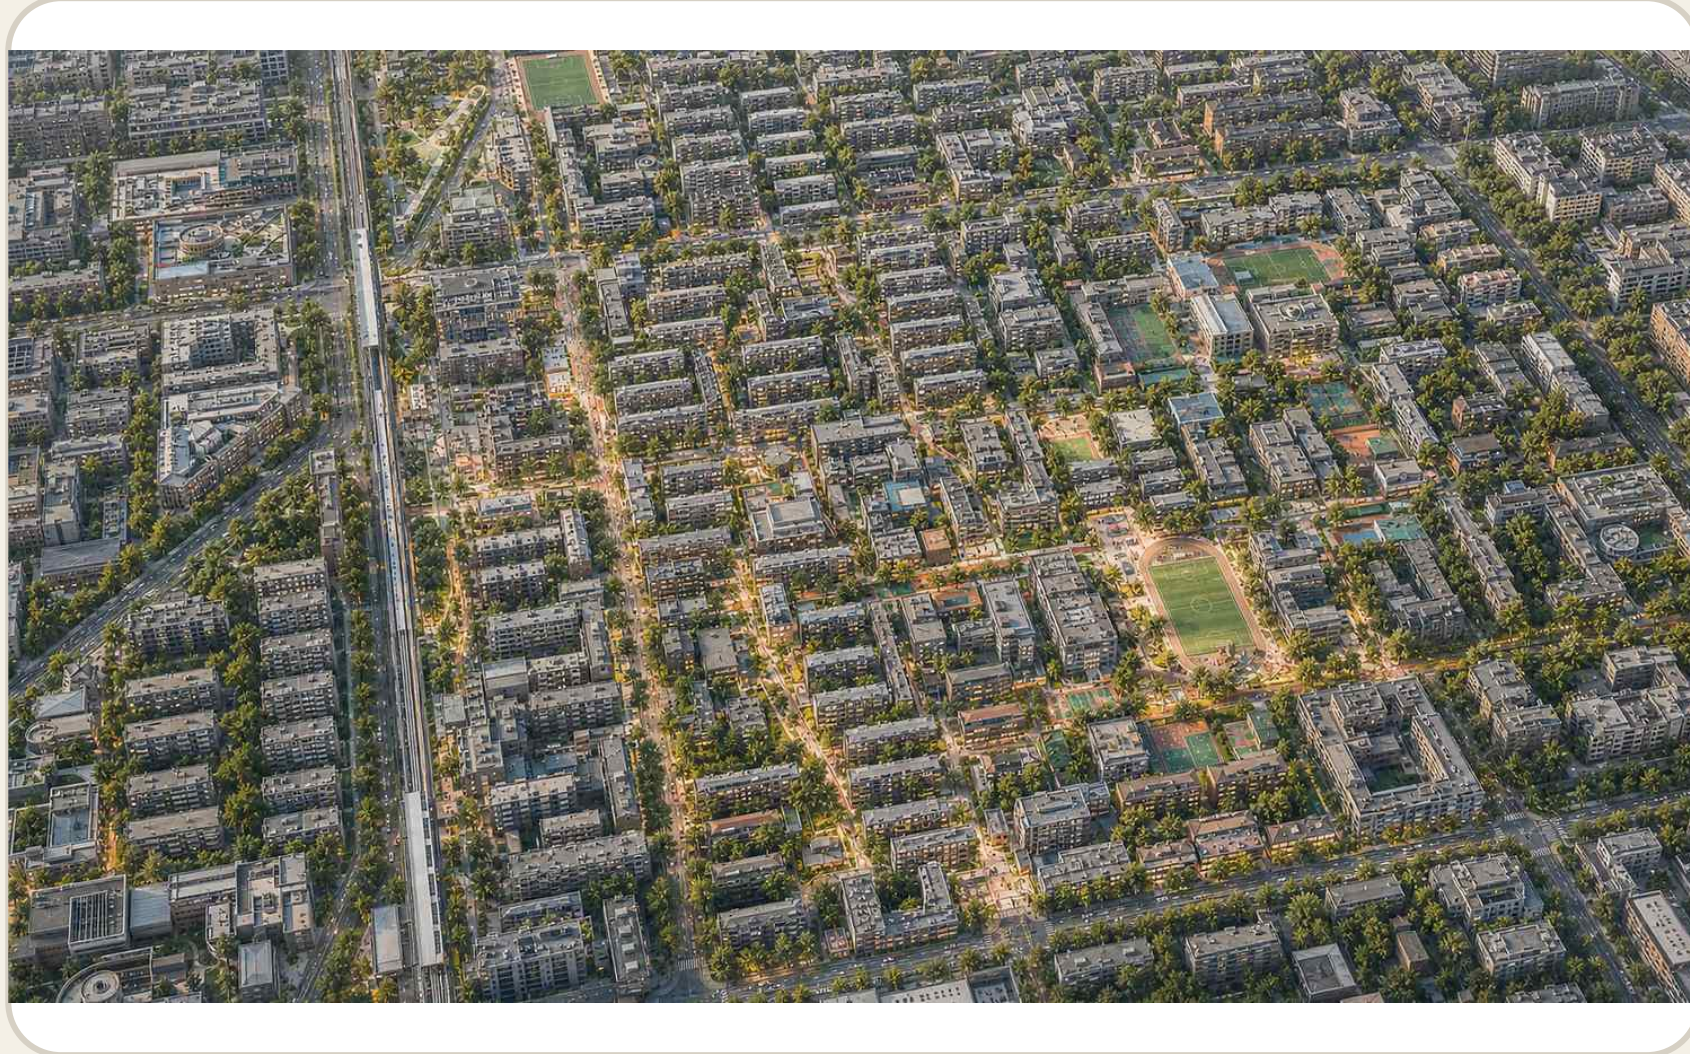

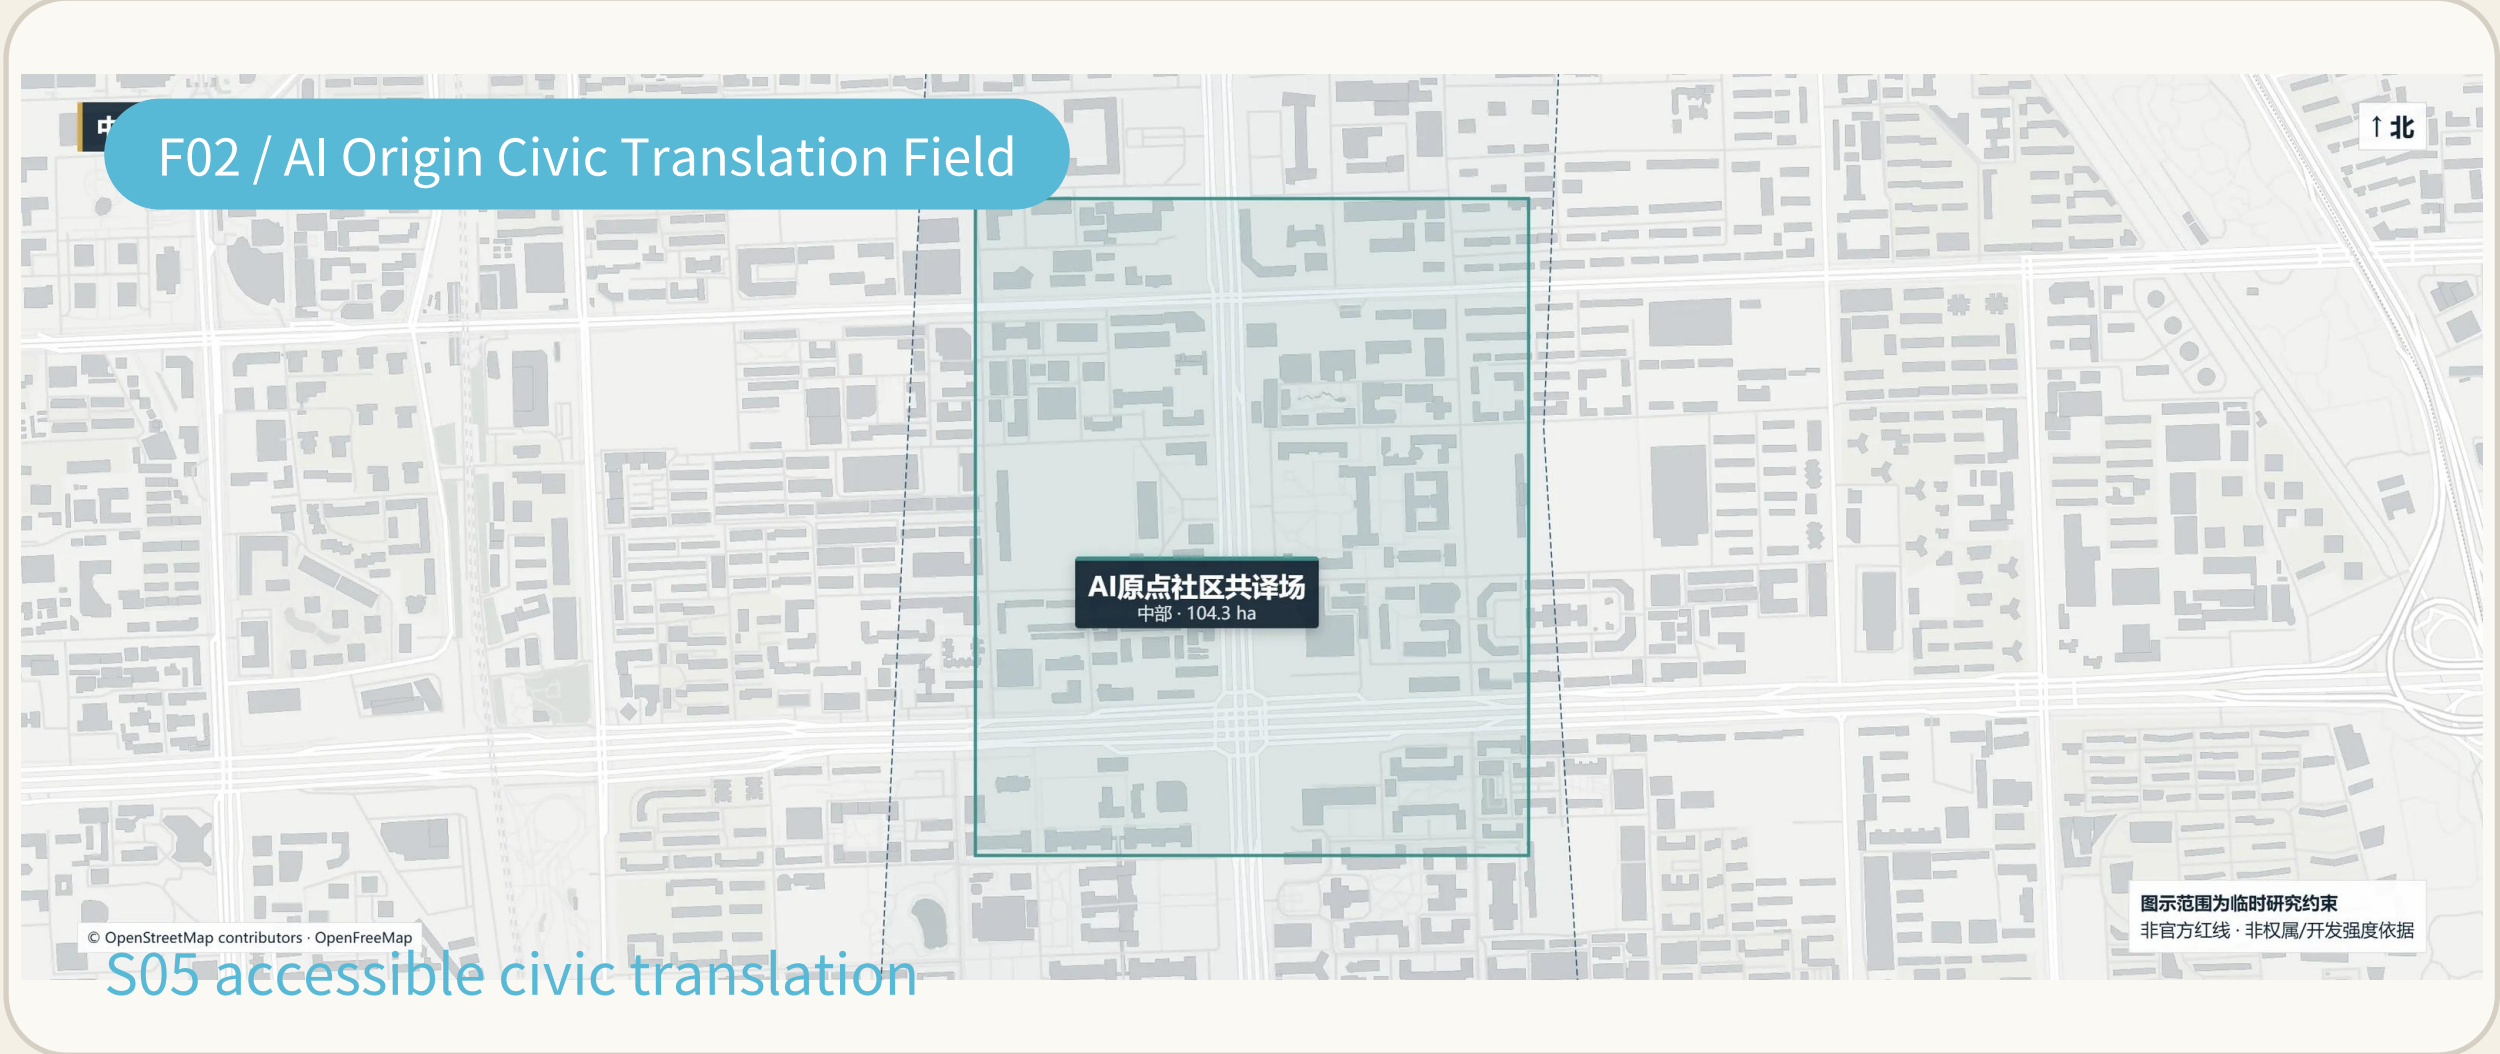

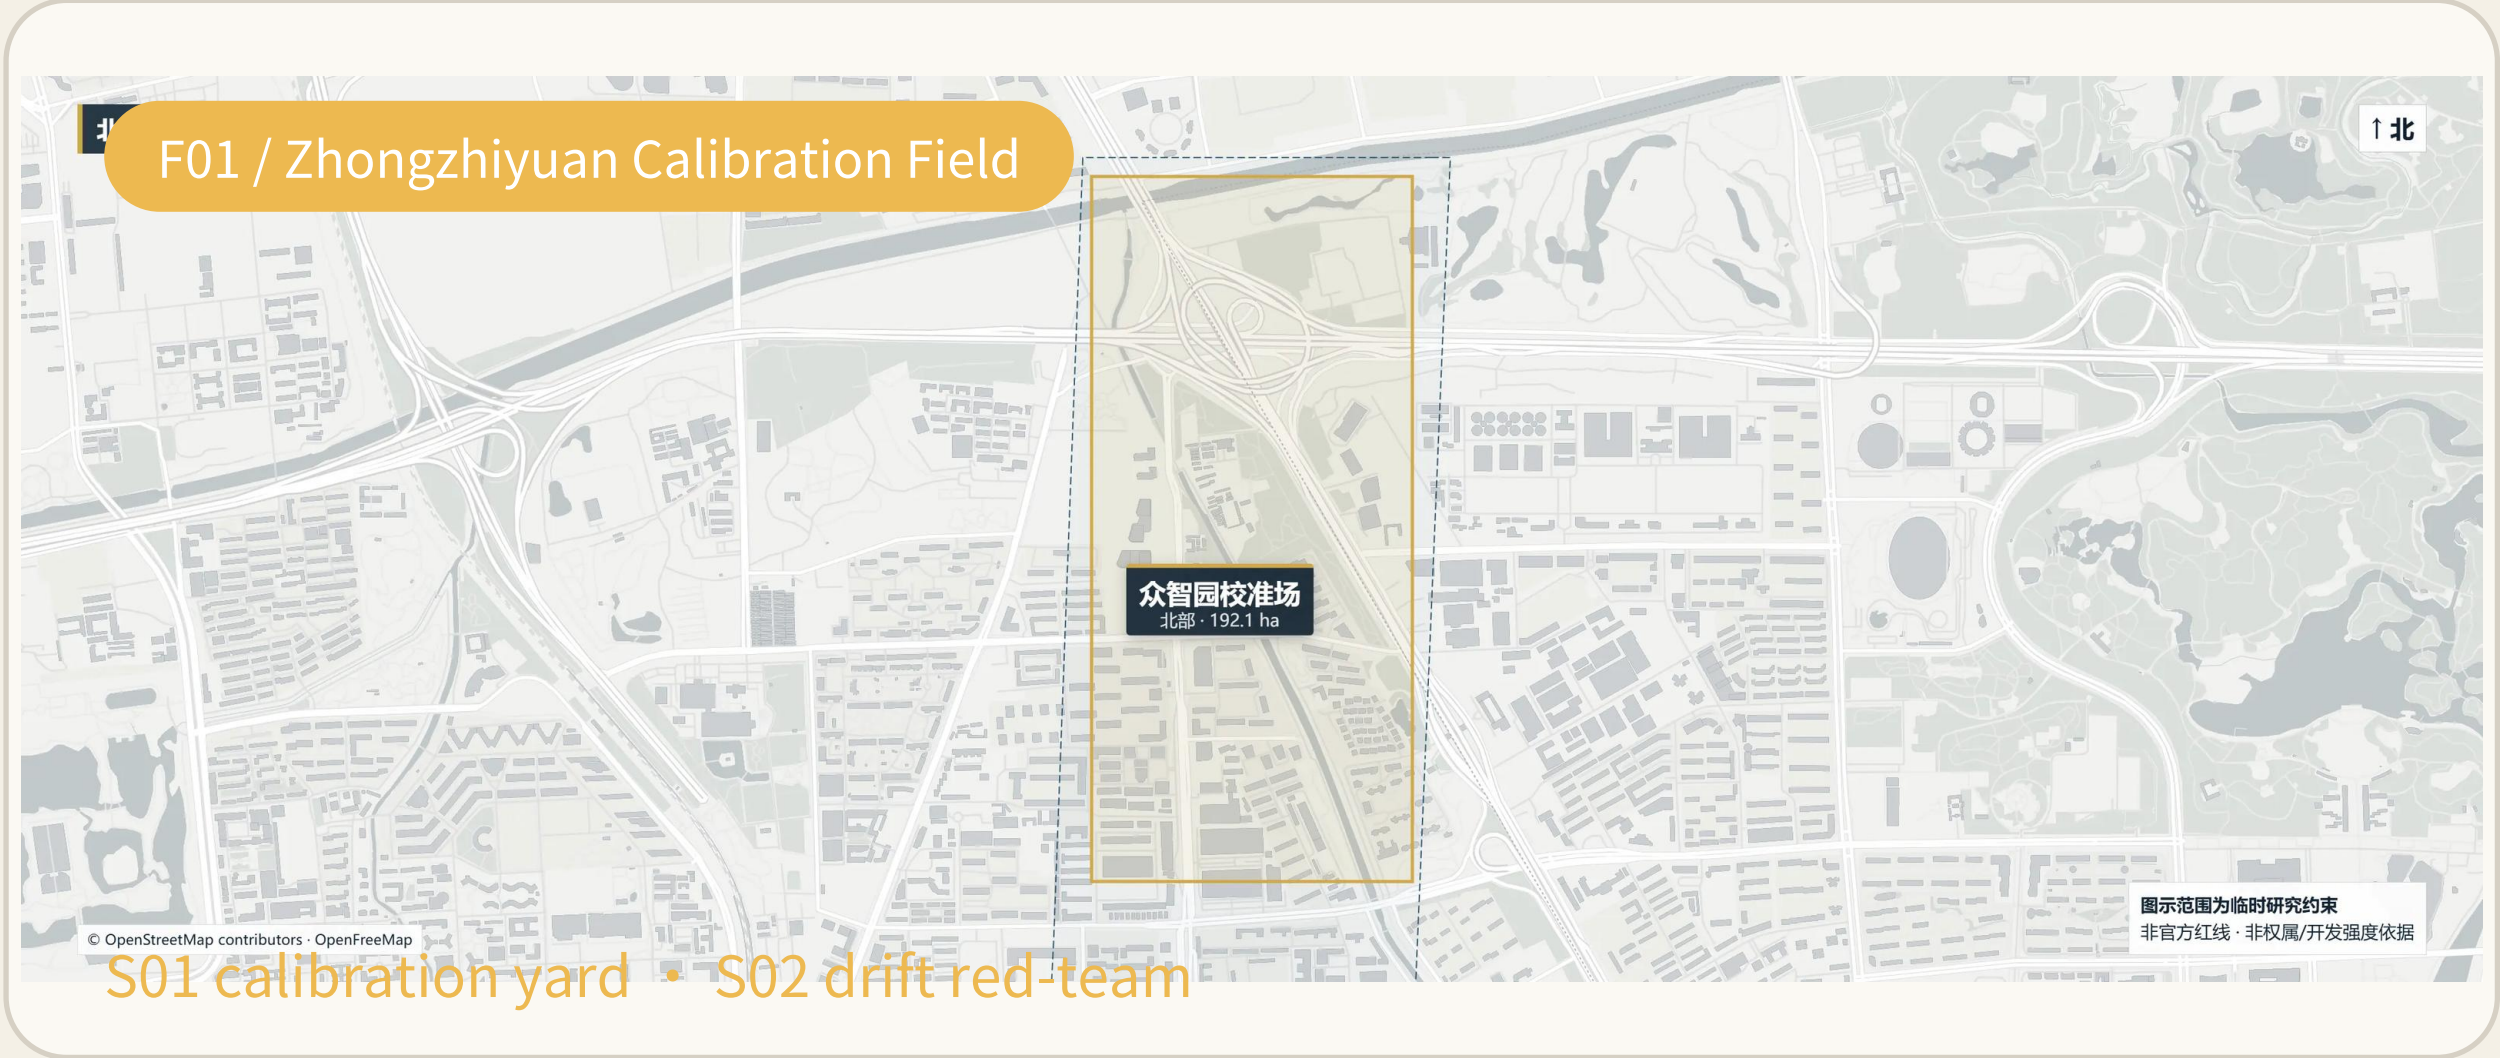

District plans use OpenFreeMap public basemaps with concept overlays (© OpenStreetMap contributors | OpenFreeMap © OpenMapTiles); aerials are Imagegen concept expressions. Broad existing grain is retained; neither is a redline, survey, or site evidence.

核心命题 / THESIS

AI does not replace planning judgment; it connects site evidence, constrained candidate families, Pareto/negative-case comparison, HumanDecision, and rollback in one urban-design loop.

Three focus areas: each resolved through plan-section-eye-level-aerial

Separated north calibration, central translation, and south adoption fields follow existing grain and low-impact renewal; they are relay interfaces, not wholesale new districts.

District plans use OpenFreeMap public basemaps with concept overlays (© OpenStreetMap contributors | OpenFreeMap © OpenMapTiles); sections, aerials, and eye-level views are Imagegen concept expressions. Area, streets, buildings, tenure, heritage, and implementation limits remain subject to authoritative data and professional review.

A real-planning Agent: candidate families, human decisions, reversible delivery

Cleared inputs → constraints/conflicts → overall/district/node candidates → Pareto and negative tests → HumanDecision → pilot, feedback, rollback or exit.
